Indications for Revascularization in Stable CAD. ESC 2014

Extent of CAD (anatomical and/or functional)		Class ^b	Level ^c	References
For prognosis	Left main disease with stenosis >50% ^a	I	A	108,134,135
	Any proximal LAD stenosis >50% ^a	I	A	94,108,135,136
	Two-vessel or three-vessel disease with stenosis > 50% ^a with impaired LV function (LVEF<40%) ^a	I	A	93,94,108,112,121,135,137–142
	Large area of ischaemia (>10% LV)	I	B	54,91,97,99,143,144
	Single remaining patent coronary artery with stenosis >50% ^a	I	C	
For symptoms	Any coronary stenosis >50% ^a in the presence of limiting angina or angina equivalent, unresponsive to medical therapy	I	A	54,96,105,108,118–120,145

CABG or PCI in Stable CAD

ESC 2014

Extent of CAD	CABG		PCI		Ref ^c
	Class ^a	Level ^b	Class ^a	Level ^b	
One or two-vessel disease without proximal LAD stenosis.	IIb	C	I	C	
One-vessel disease with proximal LAD stenosis.	I	A	I	A	107,108,160, 161,178,179
Two-vessel disease with proximal LAD stenosis.	I	B	I	C	108,135,137
Left main disease with a SYNTAX score ≤ 22.	I	B	I	B	17,134,170
Left main disease with a SYNTAX score 23–32.	I	B	IIa	B	17
Left main disease with a SYNTAX score >32.	I	B	III	B	17
Three-vessel disease with a SYNTAX score ≤ 22.	I	A	I	B	17,157,175,176
Three-vessel disease with a SYNTAX score 23–32.	I	A	III	B	17,157,175,176
Three-vessel disease with a SYNTAX score >32.	I	A	III	B	17,157,175,176

Heart Team Approach

A Heart Team approach to revascularization is recommended in patients with unprotected left main or complex CAD.

Calculation of the STS and SYNTAX scores is reasonable in patients with unprotected left main and complex CAD.

Revascularization for Stable CAD.

ESC 2014

- Indications:
 - >50% lesion
 - Persistent symptoms despite optimal medical therapy.
 - RCT and Metanalysis of CABG vs. OMC and PCI vs OMC demonstrated
 - better angina relief with revascularization
 - Improved survival for pts with LMCA and 3VCAD.
 - Greater benefit in pts with impaired LV function.
 - DES vs. BMS: Current data proves lower stent thrombosis, MI and death with DES.

Appropriate Use Criteria (AUC) for Diagnostic Angio, for PCI and for CABG.

APPROPRIATENESS CRITERIA

ACCF/SCAI/STS/AATS/AHA/ASNC 2009 Appropriateness Criteria for Coronary Revascularization

A Report of the American College of Cardiology Foundation Appropriateness Criteria Task Force, Society for Cardiovascular Angiography and Interventions, Society of Thoracic Surgeons, American Association for Thoracic Surgery, American Heart Association, and the American Society of Nuclear Cardiology

Endorsed by the American Society of Echocardiography, the Heart Failure Society of America, and the Society of Cardiovascular Computed Tomography

“ SCAI AUC Tools “

2014 ACC/AHA/AATS/PCNA/SCAI/STS Focused Update of the Guideline for the Diagnosis and Management of Patients With Stable Ischemic Heart Disease.

J Am Coll Cardiol. 2014; doi:10.1016/j.jacc.2014.07.017

- There are no high-quality data on which to base recommendations for performing diagnostic coronary angiography because no study has randomized patients with Stable IHD to either catheterization or no catheterization.
- Additionally, the “incremental benefit” of detecting or excluding CAD by coronary angiography remains to be determined.
- The **ISCHEMIA trial** is currently randomizing patients with at least moderate ischemia on stress testing to a strategy of optimal medical therapy alone (with coronary angiography reserved for failure of medical therapy) or routine cardiac catheterization followed by revascularization (when appropriate) plus optimal medical therapy.

National Cardiovascular Data Registry (NCDR) in USA.

Monitors and reports PCI activity

CathPCI Registry[®]

Washington Hospital Center compared to 50th Percentile value for All US Hospitals - Quarter ending 2014Q1

Metric Name	My Hospital 2014Q1	
PCI Performance Measures		
1 - PCI in-hospital risk adjusted mortality (all patients)	1.83	
38 - Composite: Discharge Medications in Eligible PCI Patients	93.6	

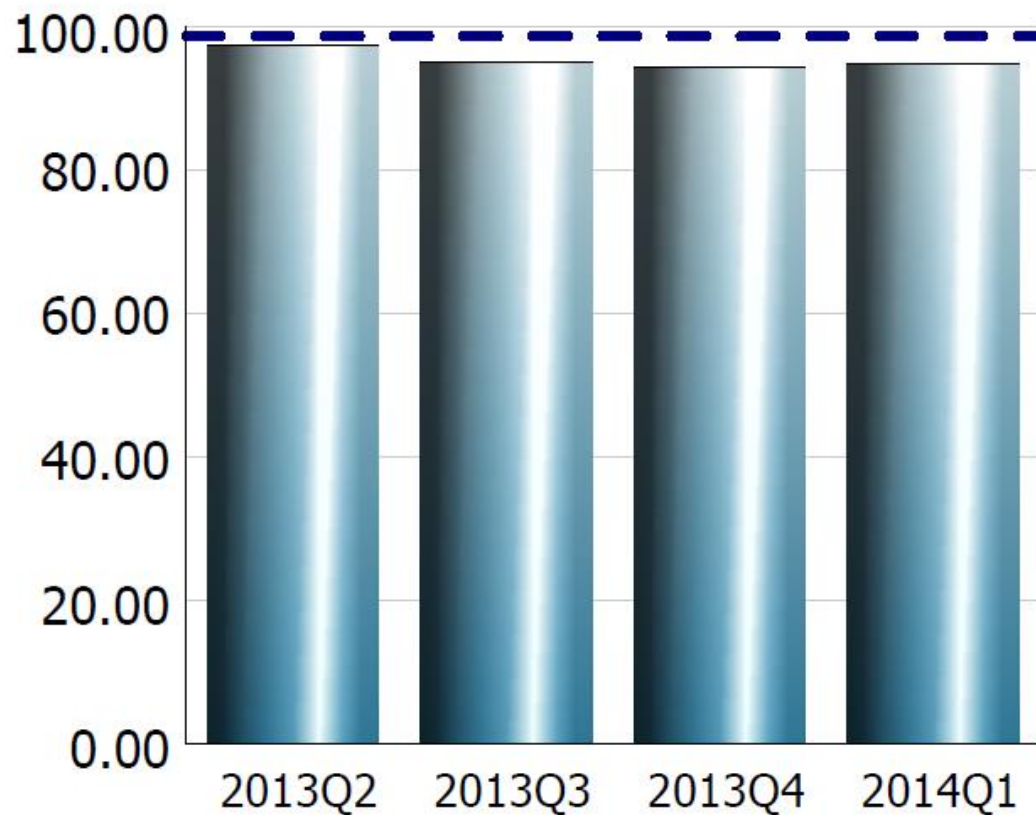

2 - Proportion of elective PCIs with prior positive stress or imaging study	73.77	
---	-------	---

4 - Proportion of STEMI patients receiving immediate PCI w/in 90'	80.00	
5 - Median time from ED arrival at STEMI transferring facility to ED arrival at STEMI receiving facility among transferred patients.	73	
6 - Median time from ED arrival at STEMI transferring facility to immediate PCI at STEMI receiving facility among transferred patients (in minutes)	111	
7 - Median fluoro time (in minutes)	10	
8 - Proportion of patients with aspirin prescribed at discharge	96.2	
9 - Proportion of patients with a P2Y12 inhibitor prescribed at discharge	99.3	
10 - Statins prescribed at discharge	97.4	

CathPCI Registry[®]

247454 - Washington Hospital Center compared to 50th Percentile value for All US Hospitals - Quarter ending 2014Q1

31 - Patients WITH Acute Coronary Syndrome: Proportion of evaluated PCI procedures that were appropriate

CathPCI Registry[®] Physician Dashboard

247454 - MedStar Washington Hospital Center

1669422960 - PICHARD,AUGUSTO

Proportion of elective PCIs with prior positive stress or imaging study

Metric	My Performance	Eligible Patients	US 50th Pctl	US 90th Pctl
Proportion of elective PCI procedures (excluding patients with ACS) with an antecedent stress or imaging study with a positive result (suggestive of ischemia) or with a fractional flow reserve value of ≤ 0.8 during the PCI procedure	75.00%	48	68.2	100

Concerns with Public Reporting.

Washington, Feb 2016

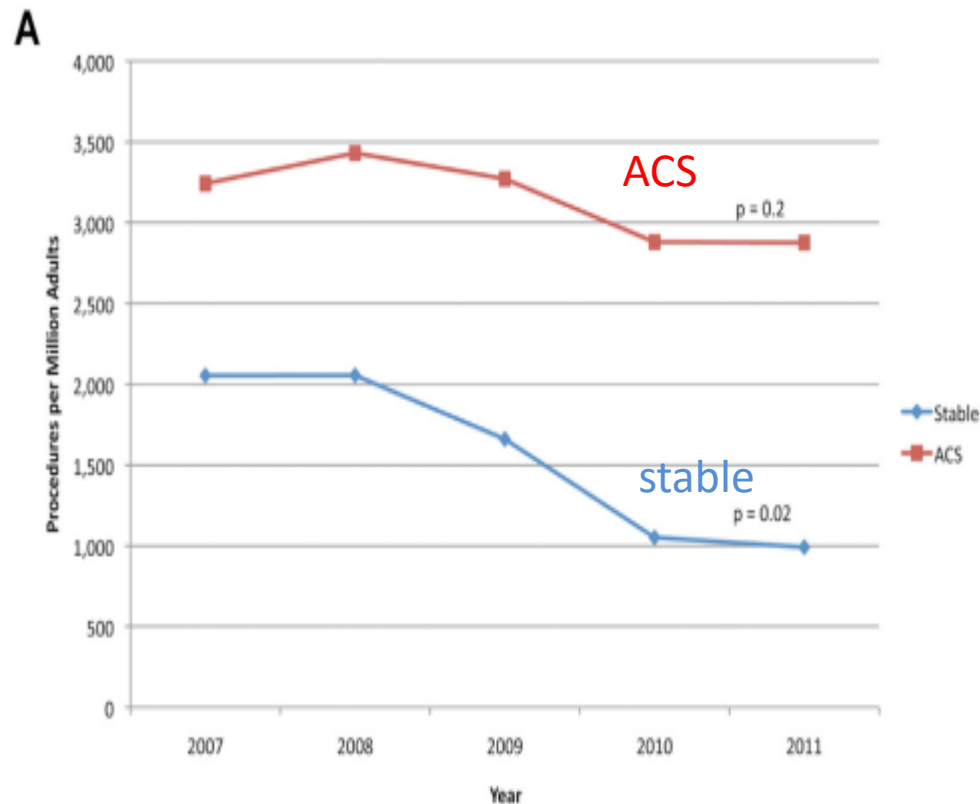

ACC and AHA have proposed to exclude from public reporting patients with OOH cardiac arrest and patients in cardiogenic shock.

Public reporting of Physician PCI Mortality could lead to:

- “risk-averse behavior” on the part of physicians**
- encouragement to transfer such patients to other facilities.**

PCI in USA for Stable and Unstable CAD.

Kim et al. AJC 2014;114:1003-10

Annual %	Stable	+0.6%	-19.3%	-36.6%	-5.7%
Change*	ACS	+5.8%	-4.7%	-11.9%	-1.5%

Summary

Close scrutiny and public reporting of indications and outcomes for diagnostic and interventional procedures is ongoing.

Intention:

- insure patients are getting maximum benefit from procedures.
- justify the expenses involved in these procedures.

Angiography (and QCA) is no Longer the Gold Standard to Indicate Revascularization

- 1. Angiography is adequate for:**
 - a. mild lesions (20-40%).**
 - b. severe lesions (>80-90%).**
- 2. Angiography is not adequate for intermediate lesions: 50-80%.**
- 3. Angio is least accurate in LMCA disease.**

- 1. Angio is no longer the gold standard**
2. IVUS has been the best for severity analysis
3. FFR proven physiologically accurate and clinically useful
4. IVUS FFR correlations surprising
5. New paradigm: FFR for intervention or not. IVUS for prognosis

QCA inaccurate for Lesion Dimensions

WHC: Mintz et al 1996

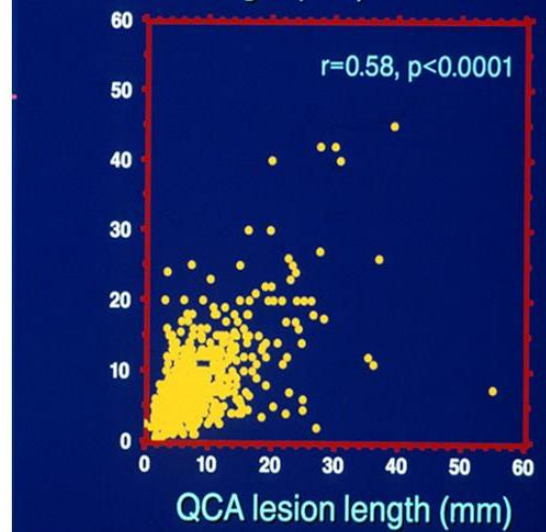

n = 2545 lesions

IVUS maximum reference
lumen diameter (mm)

QCA reference diameter

IVUS lesion length (mm)

n = 616 stents

IVUS DS (%)

FFR vs QCA

WHC: Ben-Dor et al. Eurointervention 2011 7:225-33

Angio vs CT for Stent Length

Ciszewski et al. AJC 2013;111:1111-6

A

B

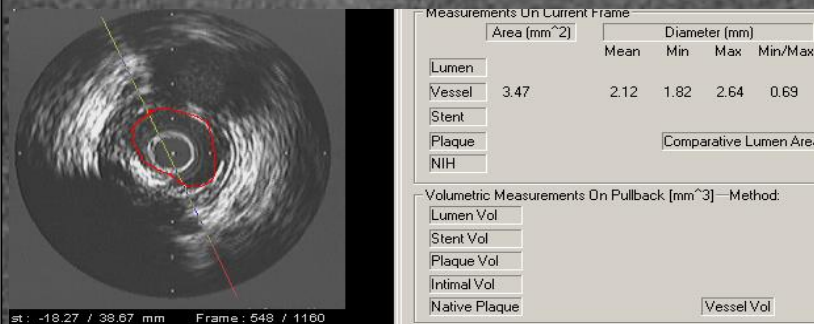

**Angiography can under estimate
severe CAD**

Patient with angina FC2 and anterior perfusion defect.

Mild angio stenosis

Severe IVUS stenosis: area 3.4 mm^2

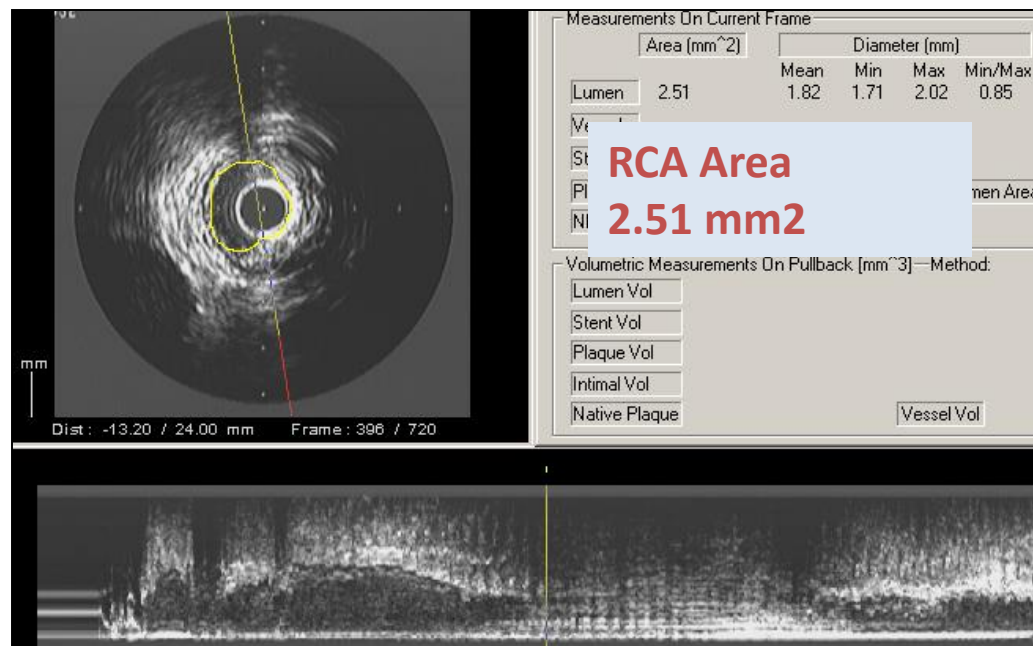

65 year old man with angina

CT: Severe stenosis

Angio: Mild stenosis

**Angiography can also over
estimate
lesion severity.
Contribution of FFR**

Circumflex Marginal

Ostial CX

Ostial OM

Prox OM

FFR CX

Equalization

Baseline Gradient

Adenosine 140 mcg

Clinical Decision

- **No PCI now.**
- **Optimal medical therapy.**
- **Non invasive follow up.**

Angio is Most Inaccurate in LM.

Olivier Muller. ESC 2011

FFR 0.89

FFR 0.68

Mild LM on Angio

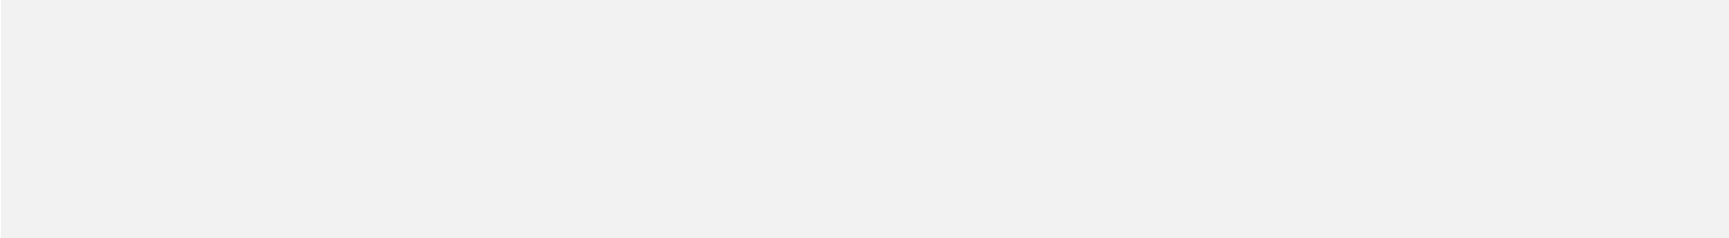

Angio vs IVUS in LMCA.

WHC: Abizaid et al JACC 1999;34:707-15

122 patients with LM disease

- 
1. Angio is no longer the gold standard
 - 2. IVUS had been the best for:**
 - a. analysis of lesion severity
 - b. for optimizing PCI results and improve outcome.
 3. FFR proven physiologically accurate and clinically useful
 4. IVUS FR correlations surprising
 5. New paradigm: FFR for intervention or not. IVUS for prognosis

IVUS final Lumen Area Determines Prognosis

WHC: Abizaid et al. Circ 1999; 100:256-261

300 patients (357 lesions) <70% diameter stenosis.

Freedom from Stent Thrombosis.

WHC: Roy et al. EHJ 2008;29:1851-7

“No IVUS” was a significant predictor of cumulative ST at 12 months: HR 3.3, CI 1.25-10, p=0.01

MACE (Definite/Probable ST, Cardiac Death, MI)

ADAPT-DES Trial

PCI with IVUS (3361 pts)
PCI without IVUS (5221 pts).

Definite/Probable ST

Myocardial Infarction

1. Angio is no longer the gold standard
2. IVUS has been the best for severity analysis
- 3. FFR is now the gold standard for physiologically and clinically significant lesion.**
4. IVUS FR correlations surprising
5. New paradigm: FFR for intervention or not. IVUS for prognosis

FFR Guidance Proven Clinically Superior than Angiographic Guidance.

DEFER 5 years

Pijls JACC 2007;49:2105

FAME two years

Pijls JACC 2010;56:177

1. Angio is no longer the gold standard
2. IVUS has been the best for severity analysis
3. FFR proven physiologically accurate and clinically useful
- 4. IVUS FFR correlations surprising**
5. New paradigm: FFR for intervention or not. IVUS for prognosis

IVUS vs. FFR

WHC: Ben-Dor et al. Eurointervention 2011 7:225-33

IVUS vs. FFR

WHC: Ben-Dor et al. Eurointervention 2011 7:225-33

881 Lesions with IVUS/FFR.

Han et al. EuroIntervention. 2012;8:N74.

QCA-FFR Discordance in LMCA.

SJ Park et al. JACC Interv 2012;5:1029-35

NO MORE 4 mm² to decide Intervention. New IVUS MLAs since 2011.

WHC: Ben-Dor et al. Eurointervention 2011 7:225-33

Reference vessel 2.5-3mm

Reference vessel 3-3.5mm

Reference vessel >3.5mm

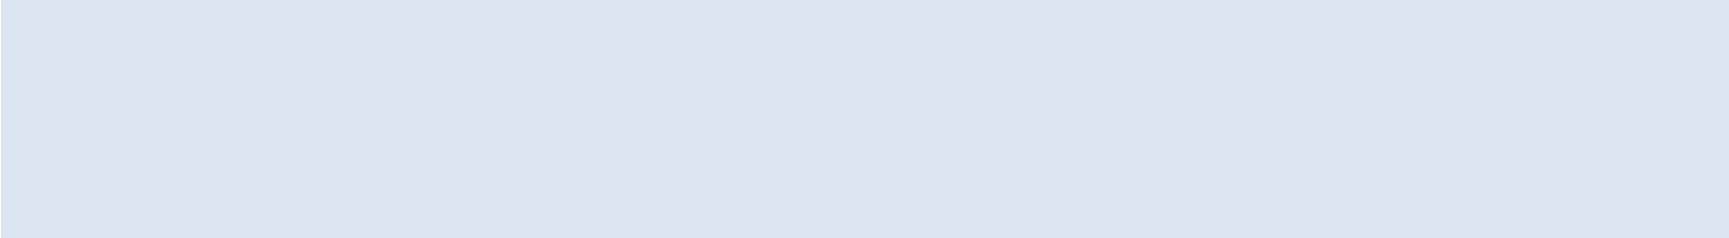

Physiologic Relevance of Angio Stenosis

Summary

Intermediate lesions (50-80%) have better outcome with Optimal Medical Therapy than with Stents.

Value of Spot Stenting.

- 
1. Angio is no longer the gold standard
 2. IVUS has been the best for severity analysis
 3. FFR proven physiologically accurate and clinically useful
 4. IVUS FFR correlations surprising
 5. **What happens to the patient with deferred intervention?**

Not all Patients are MACE Free

Pijls et al. JACC 2010;56:177

Plaque Morphology Helps Predict Prognosis

High risk plaque morphology is associated with worse outcome:

- positive remodeling/plaque burden
- thin-cap fibroatheroma
- inflammatory markers (CRP, PET scan).
- shear stress
- etc.

Plaque Positive Remodeling and Outcome.

WHC: YJ Hong et al. JIC 2007;19:500-5

236 patients with mild (<50%) LMCA stenosis by QCA.

Conclusions

- 1. In Stable CAD, non Invasive quantification of ischemia and severity of symptoms determines need for angiography.**
- 2. Angiography (QCA) is no longer the Gold Standard to indicate revascularization, except for lesions >90%.**
- 3. FFR is presently the optimal method to decide if intervention is needed in angiographic intermediate lesions (50-80%).**
- 4. IVUS (OCT) contributes greatly to achieve optimal PCI and should be used in complex, high risk PCI.**
- 5. Plaque imaging (IVUS, OCT, MSCT, MRI, NIR, PET, etc) can help predict outcome.**

The end
